

Quinto 1823
LETTERS
OF
EULER
ON DIFFERENT SUBJECTS
IN
NATURAL PHILOSOPHY.

ADDRESSED TO
A GERMAN PRINCESS.

WITH
NOTES, AND A LIFE OF EULER,
BY DAVID BREWSTER,
L.L.D. F.R.S. LOND. & ED.

THIRD EDITION.
IN TWO VOLUMES.

VOL. II.

EDINBURGH:
PRINTED FOR W. & C. TAIT, PRINCE'S STREET; AND
LONGMAN, HURST, REES, ORME, BROWN,
AND GREEN, LONDON.

1823.

CONTENTS

OF THE

SECOND VOLUME.

LETTER	PAGE
I. CONTINUATION of the Subject, and of Mistakes in the Knowledge of Truth -	1
II. First Class of known Truths. Conviction that Things exist externally, corresponding to the Ideas represented by the Senses. Objection of the Pyrrhonists. Reply. -	4
III. Another Objection of the Pyrrhonists against the Certainty of Truths perceived by the senses. Reply; and Precautions for attaining assurance of sensible Truths -	7
IV. Of demonstrative, physical, and particularly of moral Certainty -	10
V. Remarks that the Senses contribute to the increase of knowledge; and Precautions for acquiring the certainty of Historical Truths -	14
VI. Whether the Essence of Bodies be known by us -	17
VII. The true Notion of Extension -	20
VIII. Divisibility of Extension <i>in infinitum</i> -	23
IX. Whether this Divisibility <i>in infinitum</i> takes Place in existing Bodies? -	27
X. Of Monads -	30
XI. Reflections on Divisibility <i>in infinitum</i> , and on Monads -	33
XII. Reply to the Objections of the Monadists to Divisibility <i>in infinitum</i> -	37
XIII. Principle of the <i>sufficient Reason</i> , the strongest Support of the Monadists -	39
XIV. Another Argument of the Monadists, derived from the Principle of the <i>sufficient Reason</i> . Absurdities resulting from it -	43

CONTENTS.

LETTER	PAGE
XV. Reflections on the System of Monads	46
XVI. Continuation	49
XVII. Conclusion of Reflections on this System	52
XVIII. Elucidation respecting the Nature of Colours	55
XIX. Reflections on the Analogy between Colours and Sounds	59
XX. Continuation	62
XXI. How opaque Bodies are rendered visible	65
XXII. The Wonders of the Human Voice	67
XXIII. A Summary of the principal Phenomena of Electricity	71
XXIV. The true Principle of Nature, on which are founded all the Phenomena of Electricity	74
XXV. Continuation. Different Nature of Bodies relatively to Electricity	77
XXVI. On the same Subject	80
XXVII. Of positive and negative Electricity. Explanation of the Phenomenon of Attraction	84
XXVIII. On the same Subject	87
XXIX. On the electric Atmosphere	90
XXX. Communication of Electricity to a Bar of Iron, by Means of a Globe of Glass	94
XXXI. Electrification of Men and Animals	97
XXXII. Distinctive Character of the two Species of Electricity	100
XXXIII. How the same Globe of Glass may furnish at once the two Species of Electricity	103
XXXIV. The Leyden Experiment	106
XXXV. Reflections on the Cause and Nature of Electricity, and on other Means proper to produce it	109
XXXVI. Nature of Thunder: Explanations of the ancient Philosophers, and of <i>Descartes</i> : Resemblance of the Phenomena of Thunder to those of Electricity	113
XXXVII. Explanation of the Phenomena of Lightning and Thunder	116
XXXVIII. Continuation	119

CONTENTS.

LETTER	PAGE
XXXIX. The Possibility of preventing and of averting the Effects of Thunder	122
XL. On the celebrated Problem of the Longitude; General Description of the Earth, of its Axis, its two Poles, and the Equator	126
XLI. Of the Magnitude of the Earth; of Meridians, and the shortest Road from Place to Place	129
XLII. Of Latitude, and its Influence on the Seasons and the Length of the day	133
XLIII. Of Parallels, of the First Meridian, and of Longitude	137
XLIV. Choice of the first Meridian	140
XLV. Method of determining the Latitude, or the Elevation of the Pole	144
XLVI. Knowledge of the Longitude, from a Calculation of the Direction, and of the Space passed through	148
XLVII. Continuation. Defects of this Method	151
XLVIII. Second Method of determining the Longitude, by means of an exact Time-Piece	154
XLIX. Continuation, and farther Elucidations	158
L. Eclipses of the Moon, a third Method of finding the Longitude	161
LI. Observation of the Eclipses of the Satellites of Jupiter, a fourth Method of finding the Longitude	165
LII. The Motion of the Moon, a fifth Method	168
LIII. Advantages of this last Method: its Degree of Precision	172
LIV. On the Mariner's Compass, and the Properties of the Magnetic Needle	175
LV. Declination of the Compass, and Manner of observing it	179
LVI. Difference in the Declination of the Compass at the same Place	182
LVII. Chart of Declinations; Method of employing it for the Discovery of the Longitude	186
LVIII. Why does the Magnetic Needle affect, in every Place of the Earth, a certain Direc-	

	tion, differing in different Places, and for what Reason does it change, with Time, at the same Place?	190
LIX.	Elucidations respecting the Cause and Variation of the Declination of Magnetic Needles	193
LX.	Inclination or Dip of Magnetic Needles	197
LXI.	True Magnetic Direction; subtile Matter which produces the Magnetic Power	201
LXII.	Nature of the Magnetic Matter, and of its rapid Current. Magnetic Canals	205
LXIII.	Magnetic Vortex. Action of Magnets upon each other	208
LXIV.	Nature of Iron and Steel. Method of communicating to them the Magnetic Force	211
LXV.	Action of Loadstones on Iron. Phenomena observable on placing pieces of Iron near a Loadstone	216 219
LXVI.	Arming of Loadstones	223
LXVII.	Action and Force of armed Loadstones	223
LXVIII.	The Method of communicating to Steel the Magnetic Force, and of magnetizing Needles for the Compass: the <i>Simple Touch</i> , its Defects; means of remedying these	226
LXIX.	On the <i>Double Touch</i> . Means of preserving the Magnetic Matter in magnetized Bars	230
LXX.	The Method of communicating to Bars of Steel a very great Magnetic Force, by means of other Bars which have it in a very inferior degree	234
LXXI.	Construction of artificial Magnets in the form of a Horse-shoe	237
LXXII.	On Dioptrics; Instruments which that Science supplies: of Telescopes and Microscopes. Different Figures given to Glasses or Lenses	241
LXXIII.	Difference of Lenses with respect to the curve of their surfaces. Distribution of Lenses into three classes	244

LXXIV.	Effect of Convex Lenses	247
LXXV.	The same Subject: Distance of the Focus of Convex Lenses	250
LXXVI.	Distance of the Image of Objects	254
LXXVII.	Magnitude of Images	257
LXXVIII.	Burning-Glasses	260
LXXIX.	The Camera Obscura	264
LXXX.	Reflections on the Representation in the Camera Obscura	268
LXXXI.	Of the Magic Lantern, and Solar Microscope	271
LXXXII.	Use and Effect of a simple Convex Lens	274
LXXXIII.	Use and Effect of a Concave Lens	277
LXXXIV.	Of apparent Magnitude, of the Visual Angle, and of Microscopes in general	281
LXXXV.	Estimation of the Magnitude of Objects viewed through the Microscope	284
LXXXVI.	Fundamental Proposition for the construction of simple Microscopes. Plan of some simple Microscopes	288
LXXXVII.	Limits and Defects of the simple Microscope	291
LXXXVIII.	On Telescopes, and their Effect	294
LXXXIX.	Of Pocket-Glasses	297
XC.	On the magnifying power of Pocket-Glasses	301
XCI.	Defects of Pocket-Glasses. Of the apparent Field	305
XCII.	Determination of the apparent Field for Pocket-Glasses	308
XCIII.	Astronomical Telescopes, and their magnifying Power	312
XCIV.	Of the apparent Field, and the Place of the Eye	314
XC.V.	Determination of the magnifying Power of Astronomical Telescopes, and the construction of a Telescope which shall magnify objects a given number of times	318
XC.VI.	Degree of Clearness	322

LETTER	PAGE
XCVII. Aperture of Object-Glasses	325
XCVIII. On Distinctness in the Expression : On the Space of Diffusion occasioned by the Aperture of Object-Glasses, and considered as the first Source of want of Distinctness in the Representation	329
XCIX. Diminution of the Aperture of Lenses, and other Means of lessening the space of Diffusion, till it is reduced to nothing	333
C. Of Compound Object-glasses	337
CI. Formation of Simple Object-glasses	340
CII. Second Source of Defect as to Distinctness of Representation by the Telescope. Different Refrangibility of Rays	344
CIII. Means of remedying this Defect by Compound Object-glasses	348
CIV. Other Means more practicable	351
CV. Recapitulation of the Qualities of a good Telescope	354
CVI. Terrestrial Telescopes with four Lenses	357
CVII. Arrangement of Lenses in Terrestrial Telescopes	361
CVIII. Precautions to be observed in the construction of Telescopes. Necessity of blackening the inside of Tubes. Diaphragms	364
CIX. In what manner Telescopes represent the Moon, the Planets, the Sun, and the fixed Stars. Why these last appear smaller through the Telescope than to the naked Eye. Calculation of the Distance of the fixed Stars, from a Comparison of their apparent Magnitude with that of the Sun	367
CX. Why do the Moon and the Sun appear greater at rising and setting, than at a certain elevation? Difficulties attending the Solution of this Phenomenon	370
CXI. Reflections on the Question respecting the Moon's apparent Magnitude : Progress toward a Solution of the Difficulty. Absurd Explanation	373

LETTER	PAGE
CXII. An attempt toward the true Explanation of this Phenomenon : the Moon appears more distant when in the Horizon than when at a great Elevation	376
CXIII. The Heavens appear under the Form of an Arch flattened toward the Zenith	379
CXIV. Reason assigned for the Faintness of the Light of Heavenly Bodies in the Horizon	383
CXV. Illusion respecting the Distance of Objects, and the Diminution of Lustre	386
CXVI. On the Azure Colour of the Heavens	388
CXVII. What the Appearance would be were the Air perfectly transparent	392
CXVIII. Refraction of Rays of Light in the Atmosphere, and its Effects. Of the Twilight. Of the apparent rising and setting of the Heavenly Bodies	395
CXIX. The Stars appear at a greater Elevation than they are. Table of Refractions	398
